BAJAJ CORPORATE OFFICE IN INDIA

_Collaborative Architecture

The design for Bajaj Electricals corporate office is an attempt to take the project above the functional contingencies of a regular corporate work place brief, imbibing the space with an architectural character that would generate unparallel work efficiency.
The project had typical straight jacketed, hierarchical brief for a corporate office, with cabins for senior managers, cubicles for mid-level managers and workstations for executives, meeting room conference room, staff area and service areas. The brief was also emphasised to have orthogonal spaces in the office, in line with traditional Indian 'Vastu' principles.
Sustainability as an active strategy was fundamental theme right from the inception of concept design through selection of green rated products, active tools to cut down the energy consumption, day light harvesting and the general orientation of the work floor to tap maximum day light and reduce the south exposure to cut down cooling load.

The design challenge was to accommodate these highly debilitating guidelines, yet evolve a 'design narrative' which will cleverly mask the ubiquitous gridded plan.
Meeting room is placed strategically to segregate the public interface with the work interface. The contrasting dark colour and the free flowing envelope of its space clearly generate a spatial boundary between Public-Work realms.
Enclosed spaces like senior manager cabins, conference, staff utility areas are positioned along one of the sides, allowing the workstations to be positioned to tap maximum day lighting.
The cabins have glazed partitions separating them from the workspace, allowing the day light to penetrate in to the cabin spaces. Collaborative designed the architectural graphics on the wall to ensure adequate privacy in the cabin area.
Every cabin, passages and entry foyers are provided with active tools to cut down the lighting load. The office is equipped with state of the art HVAC and BMS to make it truly energy efficient.
